

Lesson 1:

- The Business Enterprise
as a system**
- Overview of Business
Process Design**

ENTERPRISE

- is a term used in the business world to denote a project or venture that is conducted for profit.
- It's frequently used in conjunction with the word "business," as in "business enterprise."
- It is usually synonymous with "undertaking" (plan or venture), company or "firm" because it refers to the commercial entity that carries out the endeavour (attempt or effort).

BUSINESS ENTERPRISE

- **is a limited liability corporation; incorporated professional association, joint venture, estate, or trust**

The motives of entrepreneurs:

Financial motives pertain to an entrepreneur who starts a business in order to make money, which might be in the form of income or profit.

- ✓ **Income** is the amount of money paid to an entrepreneur as a compensation or salary. Employees can earn money in any firm, but an entrepreneur may prefer to do it while working for themselves.

Profit refers to the amount of money left over after all business expenses have been deducted from sales income. An entrepreneur could make more money from their own business than from working for someone else if a business makes a huge profit.

Non-financial motives

They refer to an entrepreneur's decision to start a company for reasons other than profit. Personal pleasure, challenge, being your own boss, and independence are all possible reasons. An entrepreneur may feel a level of personal satisfaction that they have created a successful business. It may be that an entrepreneur is able to make a business out of a hobby or interest.

Challenge relates to an entrepreneur who starts a business with the purpose of challenging themselves or forcing them to step outside of their comfort zone in order to make it successful.

Being your own boss allows an entrepreneur to have ownership over his or her company and make decisions regarding how it is run. These decisions could affect what the company sells, where it gets raw materials, and how much it charges for its product or service.

Independence denotes a person who works by oneself and runs their own company. They will also make critical business decisions on their own. An entrepreneur's desire for independence is a common cause for starting a firm.

Social/community motives

Doing things in an ethical or ecologically friendly manner, or establishing a firm whose main purpose is to meet a social or community need, are all examples of social purposes. For example, an entrepreneur may want to provide only environmentally sourced items or run their business entirely on solar energy. The term "social enterprising" refers to businesses that are established for social or community purposes.

The risks and rewards of business enterprise

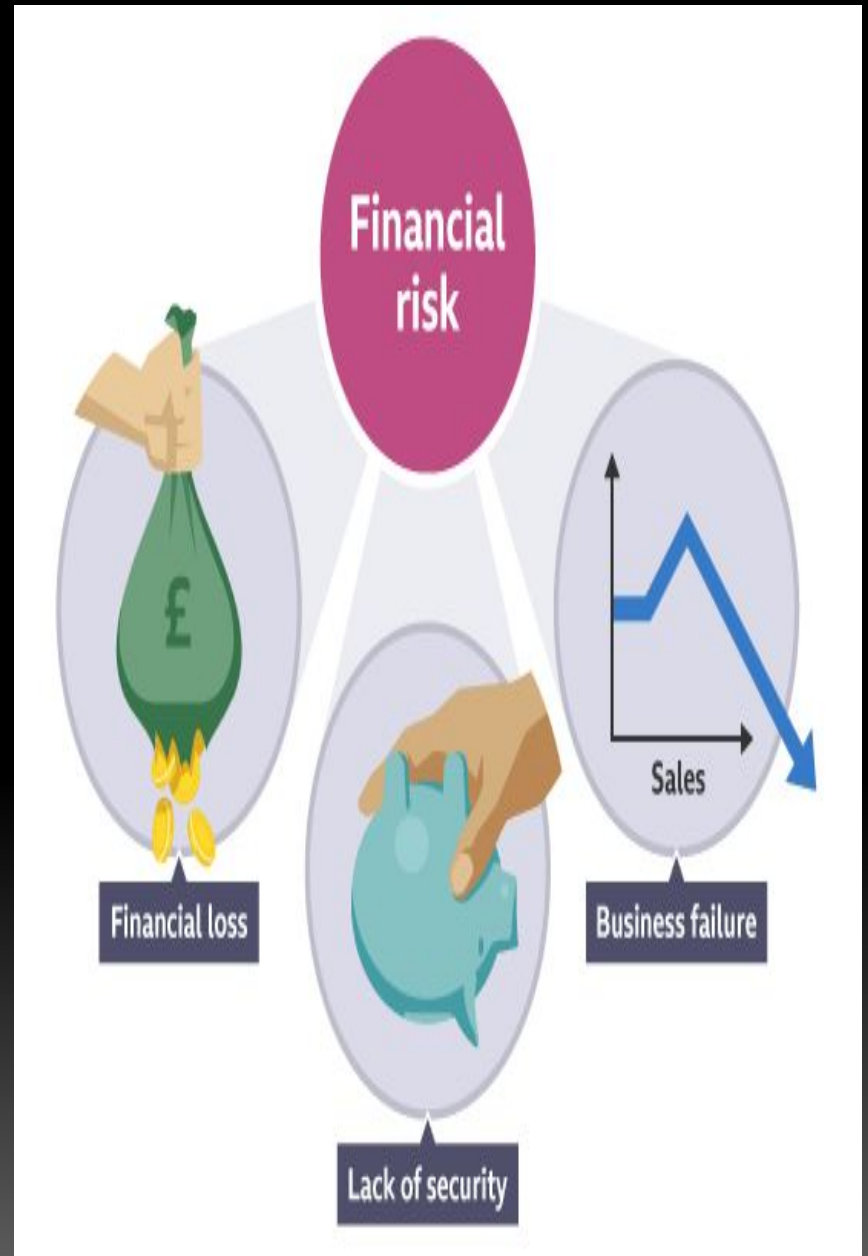

Business rewards may include:

- profit
- satisfaction and a sense of achievement for building something new
- being able to build a successful business
- receiving positive customer feedback and a good reputation
- being in control

Business risks may include:

- giving up job security to open a business
- risk of low sales
- risk of unexpected events and rises in costs
- financial loss
- business failure

Business Process Design Overview

Business process design (BPD) is the act of starting from scratch to create a new process or workflow. It's not the same as business process redesign, which, as the name implies, entails improving an existing process.

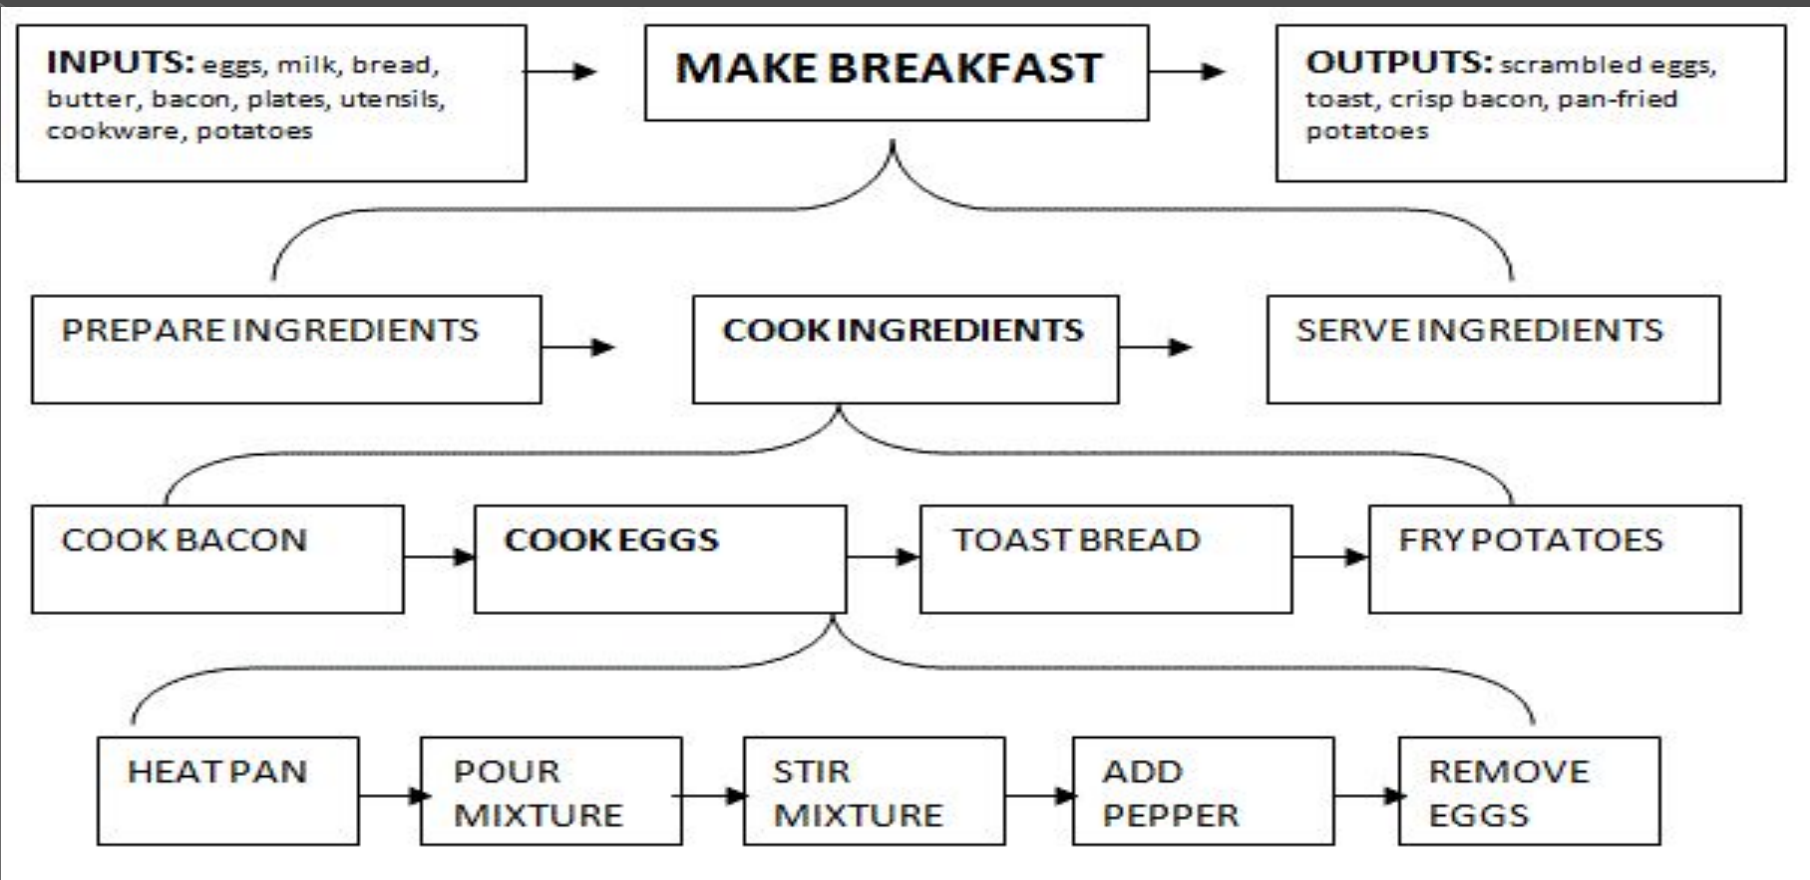

Any type of business relies on its processes to function. By definition, a process is a set of repeated procedures that must be followed in order to achieve a specific business goal. The phrase "repeatable" is crucial here.

The more efficient your processes, the better your business will perform.

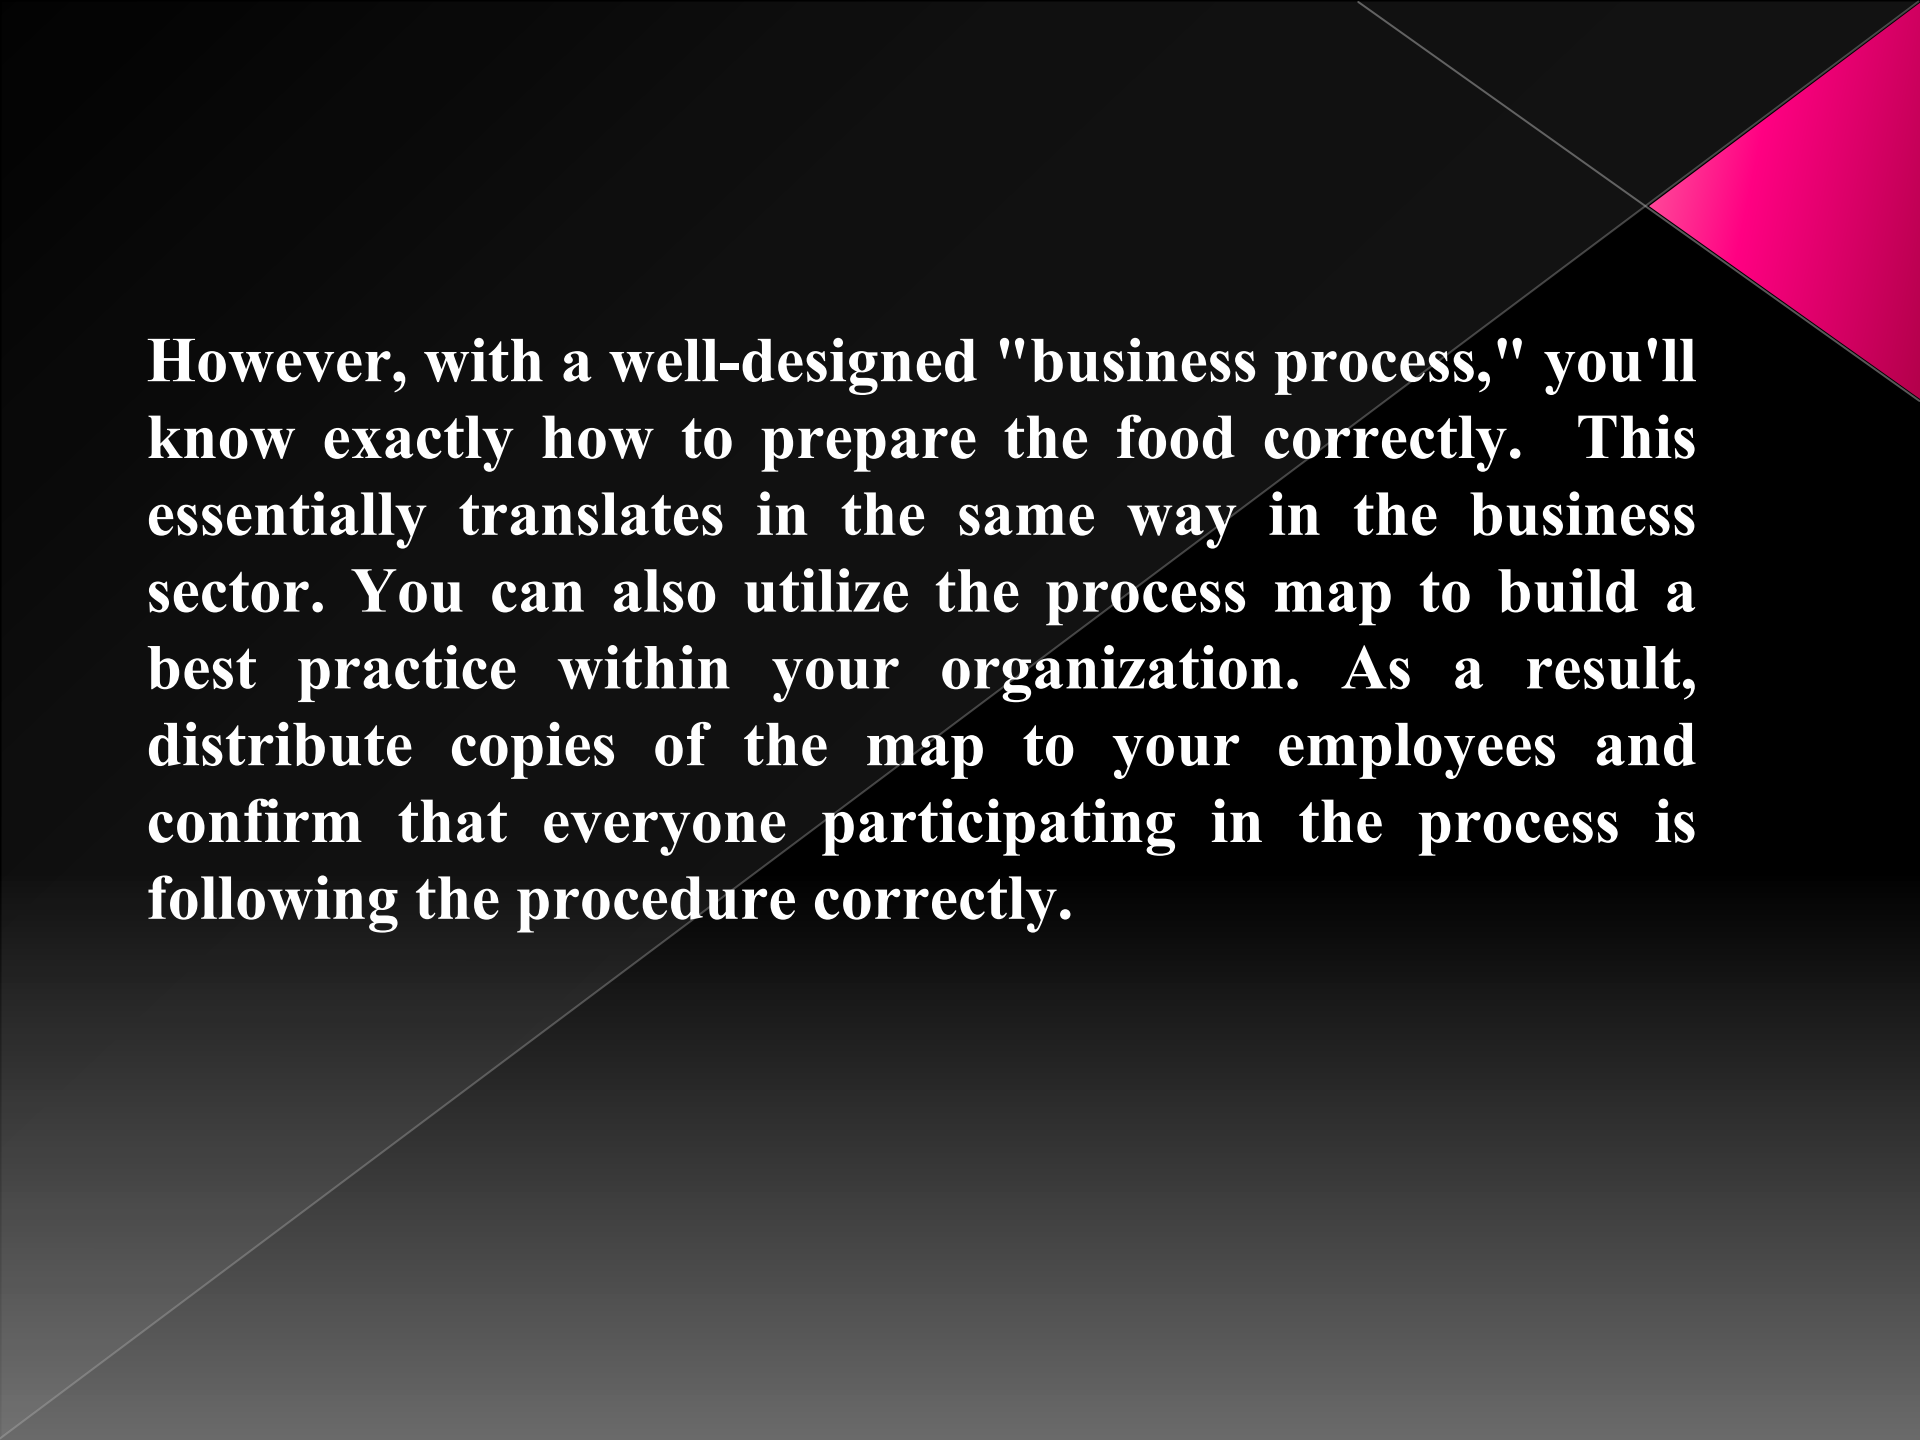

How To Do Business Process Design

- ❑ Business process design is typically done when you're just starting out in your business and need to describe how you'll perform specific tasks as well as what procedures you'll use.
- ❑ This is something that most businesses do without even realizing it. They don't develop business processes at all. That is, they do not graph, structure, or analyze it. Rather, the procedure is something they're accustomed to.
- ❑ A structured method, on the other hand, entails mapping out and optimizing your process for efficiency.
- ❑ Let's pretend that the "business process" in question is the act of preparing breakfast. You may do it by memory, or you could have a process map with detailed instructions:

In the example, while you're unlikely to make a major blunder when making breakfast, you might miss a step or two, or do things in the wrong sequence. In the worst-case situation, you destroy the dinner or make it less tasty than it could be.

However, with a well-designed "business process," you'll know exactly how to prepare the food correctly. This essentially translates in the same way in the business sector. You can also utilize the process map to build a best practice within your organization. As a result, distribute copies of the map to your employees and confirm that everyone participating in the process is following the procedure correctly.
